

What is a Data Center

A **Data Center** is a facility used to house computer systems and associated components. These systems may include telecommunication and storage equipment as well as redundancy devices, backup power supplies, back up data connections, environmental controls and applications. Meanwhile, **Managed Data Services** are technology related facilities, components and activities supporting projects and operations of a data center and generally comes in two categories: services provide for a data center and services provided to a data center.

One of company's major concerns is ensuring business continuity as they largely rely on their systems. **Data Centers** commonly provide services that include, but not limited to:

- Technical Support
- Technical Consulting Services
- Outsourcing services
- Application services
- Technical training services
- Financing and leasing services

Market Overview

The **Managed Data Center Services market** has greatly gained importance in the more recent years, primarily due to the adoption of cloud-based platforms and the successful deployment of cloud-based services.

Today, Small to Medium-size Enterprises are manifesting great interest in the outsourcing of their IT services to third-party vendors. Organizations are turning to managed services in building their profit and to bring down their expenses.

The **North American market** became the **largest market in managed services**, which accounted to **35.08% of over-all volume**. Together with Europe, has accounted to 63% of the global market.

Forecast from Market Research shows that:

Managed Data Center Services will have a 21.4% CAGR in a five year period, from 2013 through 2018.
